

'Purity Monitor'

Features:

Measures electron drift lifetime (function of E field?) (few %)

Self-calibrating:

Can determine drift-velocity (at E-field of PrM), and so sensitive to Temperature (fraction of a K).

Schematic of Liquid Argon Purity Monitor (PrM)

2/5/06

1st Good Signal in Liquid, 2/3/06

1

Measurement of the drift time
 of electrons in liquid argon
 18/10/2007

PrM drawing

C.Kendziora2/3.05

PrM photograph

$$t_{\text{drift}} = 150 \mu\text{s}, Q_{\text{anode}}/Q_{\text{cathode}} = \sim 1$$

10/2007

sensitivity to temperature

Issues:

do not know long term (years) photo-cathode sensitivity

requires non-solarizable quartz fibers, $\lambda \sim 1$ meter

how many? (reliability, and spatial variations in liquid)

feedthrough (for Jack)
