

I more or less just took the data as they were given to me and performed the proper conversions and then plotted them. The only thing noteworthy is that while data were collected until 2/18, argon flow and the DF-560 were stopped on 2/15 around at 8:55. I didn't consider this last portion of the data. There is obviously no data from the DF-560, and the hygrometer just slowly increased to about 1000 ppm over the final three days.

—○— Oxygen

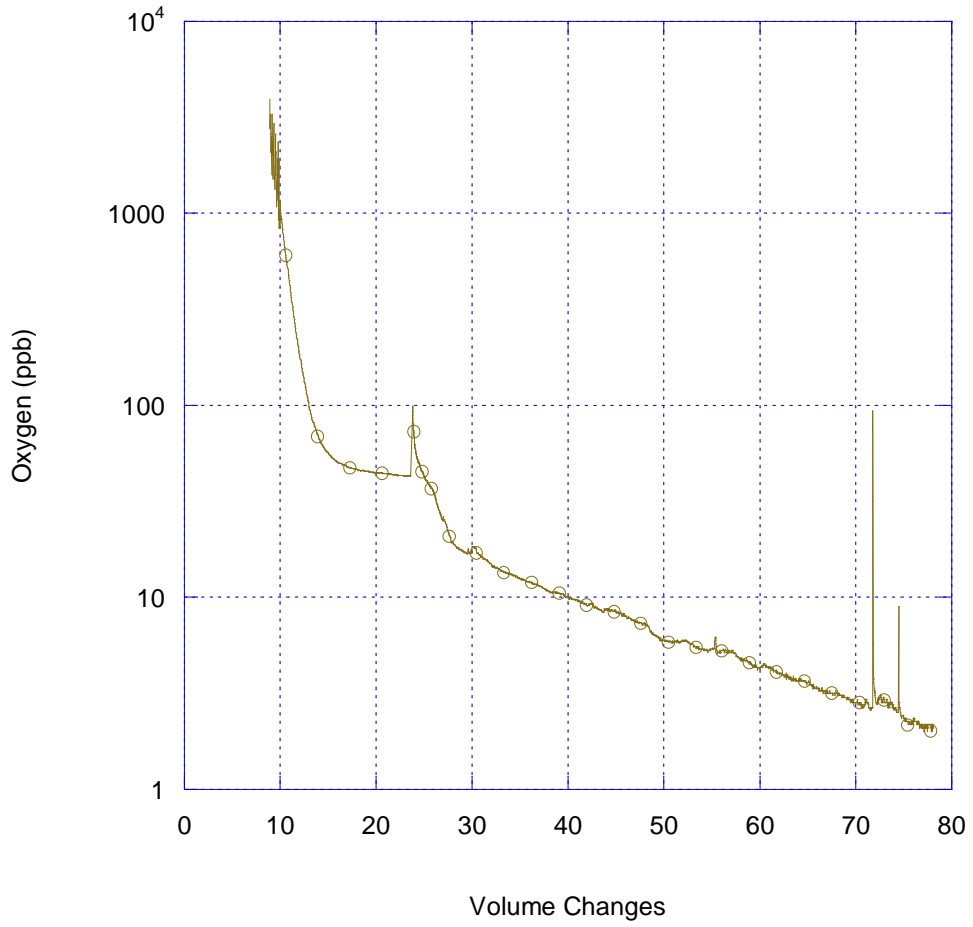

—○— H2O

I've also included the previous plots for comparison purposes.
